

Individual reflection Lv4

We have now finished our first sprint and are working at a good pace with the project which is progressing as planned. We have had several meetings and discussion where our working process has been evaluated, and the collaboration and teamwork is going well in my opinion. The previous week I mentioned my difficulties with the coding process and lack of skills in React. I have now been able to program in pairs which felt much better, and I think that is the best way forward for me in order to learn. I have worked with Viktor, another student from the I-program, and it has been very satisfying since we both can work in a slower pace while focus on understanding.

- what do I want to learn or understand better?

Right now, I am starting to improve my knowledge in Git and react which makes it easier to contribute. However, I would like to understand the React and Java Script Syntax better. This is important in order to be able to write code and understand written code. To get there, I will have to spend more time learning and experimenting on my own, and not work on the actual project itself.

- how can I help someone else, or the entire team, to learn something new?

I hope to able to help by implementing scrum and being active and engage during the meetings in order to ensure that we proceed and work systematically. This hasn't changed since last week. In order to do that I will use my role as a secretary and make sure we have proper discussions with proper topics, also by ensuring everyone now how the project is progressing.

- what is my contribution towards the team's deliveries?

My contribution to the team deliveries is more focused on the process, discussing ideas and collaborating with others. However, I would like to contribute more to the coding process and will therefore try to contribute by spending more time on programming in pairs and giving my ideas and opinions.
