What I want to learn or understand better: I still want to learn more about React and the connection between frontend and backend code-wise, as well as new things about working in git with code revisions and good strategies for that. Regarding Scrum I think it will be interesting to see if we will revise our previous assumptions again on something we developed from the start to go in a new direction, and why if so. Otherwise I feel much more comfortable about our way of working now than the previous weeks. At the same time I also know we have small experience with working agile so the differences overtime will be interesting in general.

How I can help someone else, or the entire team, to learn something new: I have been helping one of our team members to get on the train and be more involved in the coding process this week. I have also tried to introduce him to the things I feel that I have learnt in terms of code during the course in React, css and javascript. I want to continue to work this way and help as much as I can when needed since it makes my understanding of those things better as well, especially when I have not worked with them for a very long time either.

What my contribution is towards the team's use of Scrum: I have attended all our meetings and it turned out that this week we mostly focused on Trello in our application of Scrum. This meant that I contributed towards defining more concrete tasks. This make it more clear what people is working on (which "daily" stand-ups three times a week also have helped with) and has felt especially important for me who does not feel like all the terms used before did make it clear where I would start if I were to code it and for those I coded I did actually experience that.

What my contribution is towards the team's deliveries: I contributed with css grid and some javascript code for the design of our top list page. To be able to do this I had to learn some CSS which I felt went quite smoothly. I also started the design of a page for our FAQ and plan on keep working on this and in that way learn some things about the connection between frontend and backend as well. I also was part of creating the top lists different ways of sorting results to the frontend.
